

MSPM0L110x Mixed-Signal Microcontrollers

1 Features

- **Core**
 - Arm® 32-bit Cortex®-M0+ CPU, frequency up to 32 MHz
- **Operating characteristics**
 - Extended temperature: -40°C to 105°C
 - Wide supply voltage range: 1.62 V to 3.6 V
- **Memories**
 - Up to 64KB of flash
 - 4KB of SRAM
- **High-performance analog peripherals**
 - One 12-bit 1.68-MspS analog-to-digital converter (ADC) with up to 10 total external channels
 - Configurable 1.4-V or 2.5-V internal ADC voltage reference (VREF)
 - One general-purpose amplifier (GPAMP)
 - Integrated temperature sensor
- **Optimized low-power modes**
 - RUN: 71 µA/MHz (CoreMark)
 - STOP: 151 µA at 4 MHz and 44 µA at 32 kHz
 - STANDBY: 1.0 µA with 32-kHz 16-bit timer running, SRAM/registers fully retained, and 32MHz clock wakeup in 3.2µs
 - SHUTDOWN: 61 nA with IO wakeup capability
- **Intelligent digital peripherals**
 - 3-channel DMA controller
 - 3-channel event fabric signaling system
 - Four 16-bit general-purpose timers, each with two capture/compare registers supporting low-power operation in STANDBY mode, supporting a total of 8 PWM channels
 - Windowed watchdog timer
- **Enhanced communication interfaces**
 - Two UART interfaces; one supporting LIN, IrDA, DALI, Smart Card, Manchester and both supporting low-power operation in STANDBY
 - One I²C interface supporting FM+ (1Mbit/s), SMBus, PMBus, and wakeup from STOP
 - One SPI supporting up to 16 Mbit/s

- **Clock system**
- Internal 4- to 32-MHz oscillator with ±1.2% accuracy (SYSOSC)
- Internal 32-kHz low-frequency oscillator with ±3% accuracy (LFOSC)
- **Data integrity**
 - Cyclic redundancy checker (CRC-16 or CRC-32)
- **Flexible I/O features**
 - Up to 28 GPIOs
 - Two 5-V tolerant open-drain IOs
- **Development support**
 - 2-pin serial wire debug (SWD)
- **Package options**
 - 32-pin VQFN (RHB)
 - 28-pin VSSOP (DGS)
 - 24-pin VQFN (RGE)
 - 20-pin VSSOP (DGS)
 - 16-pin SOT (DYY), WQFN (RTR)
- **Family members** (also see [Device Comparison](#))
 - MSPM0L1105: 32KB of flash, 4KB of RAM
 - MSPM0L1106: 64KB of flash, 4KB of RAM
- **Development kits and software** (also see [Tools and Software](#))
 - LP-MSPM0L1306 LaunchPad™ development kit
 - MSP Software Development Kit (SDK)

3 Description

MSPM0L110x microcontrollers (MCUs) are part of the MSP highly-integrated ultra-low-power [32-bit MSPM0 MCU family](#) based on the enhanced Arm® Cortex®-M0+ core platform operating at up to 32-MHz frequency. These cost-optimized MCUs offer high-performance analog peripheral integration, support extended temperature ranges from -40°C to 105°C, and operate with supply voltages from 1.62 V to 3.6 V.

The MSPM0L110x devices provide up to 64KB embedded flash program memory with 4KB SRAM. These MCUs incorporate a high-speed on-chip oscillator with an accuracy up to $\pm 1.2\%$, eliminating the need for an external crystal. Additional features include a 3-channel DMA, 16 and 32-bit CRC accelerator, and a variety of high-performance analog peripherals such as one 12-bit 1.68-Msps ADC with configurable internal voltage reference, one general-purpose amplifier, and an on-chip temperature sensor. These devices also offer intelligent digital peripherals such as four 16-bit general purpose timers, one windowed watchdog timer, and a variety of communication peripherals including two UARTs, one SPI, and one I²C. These communication peripherals offer protocol support for LIN, IrDA, DALI, Manchester, Smart Card, SMBus, and PMBus.

The TI MSPM0 family of low-power MCUs consists of devices with varying degrees of analog and digital integration let customers find the MCU that meets their project needs. The architecture combined with extensive low-power modes is optimized to achieve extended battery life in portable measurement applications.

MSPM0L110x MCUs are supported by an extensive hardware and software ecosystem with reference designs and code examples to get the design started quickly. Development kits include a LaunchPad™ kit available for purchase and design files for a target-socket board. TI also provides a free MSP Software Development Kit (SDK), which is available as a component of [Code Composer Studio™ IDE](#) desktop and cloud version within the [TI Resource Explorer](#). MSPM0 MCUs are also supported by extensive online collateral, training with [MSP Academy](#), and online support through the [TI E2E™ support forums](#).

For complete module descriptions, see the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

CAUTION

System-level ESD protection must be applied in compliance with the device-level ESD specification to prevent electrical overstress or disturbing of data or code memory. See [MSP430™ System-Level ESD Considerations](#) for more information, as the principles in that application note also apply to MSPM0 MCUs.

(1) PINCM.PF and PINCM.PC in [IOMUX](#) must be set to 0 for analog functions (for example, GPAMP inputs and outputs or ADC inputs). Each digital I/O on a device is mapped to a specific Pin Control Management Register (PINCMx) that lets users configure the desired *Pin Function* using the PINCM.PF control bits.

(2) Reset PIN is muxed with PA1 for 16-pin and 20-pin devices.

	VREF-	25	24	17	–	–	–	I	Voltage reference ground supply - external reference input

(1) ‘–’ = not available

(2) I = input, O = output, I/O = input or output, P = power

(3) When using VREF+/- to bring in an external voltage reference for analog peripherals such as the ADC, a decoupling capacitor must be placed on VREF+ to VREF-/GND with a capacitance based on the external reference source

6.4 Connections for Unused Pins

Table 6-3 lists the correct termination of unused pins.

Table 6-3. Connection of Unused Pins

PIN ⁽¹⁾	POTENTIAL	COMMENT
PAx	Open	Set corresponding pin functions to GPIO (PINCMx.PF = 0x1) and configure unused pins to output low or input with internal pullup or pulldown resistor.
NRST	VCC	NRST is an active-low reset signal. Pull high to VCC or the device cannot start. For more information, see Section 9.1 .

(1) Any unused pin with a function that is shared with general-purpose I/O must follow the “PAx” unused pin connection guidelines.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
VDD	Supply voltage	At VDD pin, with respect to VSS	-0.3	4.1	V
V _I	Input voltage	Applied to any 5-V tolerant open-drain pins	-0.3	5.5	V
V _I	Input voltage	Applied to any common tolerance pins	-0.3	V _{DD} + 0.3 (4.1 MAX)	V
I _{VDD}	Current into VDD pin (source)	-40°C ≤ T _j ≤ 130°C		80	mA
		-40°C ≤ T _j ≤ 85°C		100	mA
I _{VSS}	Current out of VSS pin (sink)	-40°C ≤ T _j ≤ 130°C		80	mA
		-40°C ≤ T _j ≤ 85°C		100	mA
I _{IO}	Current for SDIO pin	Current sunk or sourced by SDIO pin		6	mA
	Current for HSIO pin	Current sunk or sourced by HSIO pin		6	mA
	Current for ODIO pin	Current sunk by ODIO pin		20	mA
I _D	Supported diode current	Diode current at any device pin		±2	mA
T _j	Junction temperature		-40	130	°C
T _{stg}	Storage temperature ⁽²⁾		-40	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Higher temperatures may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD	Supply voltage ⁽⁴⁾	1.62 ⁽⁵⁾		3.6	V
VCORE	Voltage on VCORE pin ⁽²⁾		1.35		V
C _{VDD}	Capacitor placed between VDD and VSS ⁽¹⁾		10		uF
C _{VCORE}	Capacitor placed between VCORE and VSS ⁽¹⁾⁽²⁾		470		nF
T _A	Ambient temperature, T version	-40		105	°C
	Ambient temperature, S version	-40		125	
T _J	Max junction temperature, T version			125	°C
T _J	Max junction temperature, S version			130	°C
f _{MCLK}	MCLK, CPUCLK, ULPCLK frequency with 1 flash wait state ⁽³⁾			32	MHz
	MCLK, CPUCLK, ULPCLK frequency with 0 flash wait states ⁽³⁾			24	

- (1) Connect C_{VDD} and C_{VCORE} between VDD/VSS and VCORE/VSS, respectively, as close to the device pins as possible. A low-ESR capacitor with at least the specified value and tolerance of ±20% or better is required for C_{VDD} and C_{VCORE}.

- (2) The VCORE pin must only be connected to C_{VCORE}. Do not supply any voltage or apply any external load to the VCORE pin.
- (3) Wait states are managed automatically by the system controller (SYSCTL) and do not need to be configured by application software.
- (4) There is no dependency on MCLK frequency with respect to VDD recommended operating range.
- (5) Functionality is guaranteed down to V_{BOR0-(min)}.

7.7 Flash Memory Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Supply						
VDD _{PGM/ERASE}	Program and erase supply voltage		1.62	3.6		V
IDD _{ERASE}	Supply current from VDD during erase operation	Supply current delta		2		mA
IDD _{PGM}	Supply current from VDD during program operation	Supply current delta		2.5		mA
Endurance						
NWEC _(LOWER)	Erase/program cycle endurance (lower 32kB flash) ⁽¹⁾		100			k cycles
NWEC _(UPPER)	Erase/program cycle endurance (remaining flash) ⁽¹⁾		10			k cycles
NE _(MAX)	Total erase operations before failure ⁽²⁾		802			k erase operations
NW _(MAX)	Write operations per word line before sector erase ⁽³⁾			83		write operations
Retention						
t _{RET_85}	Flash memory data retention	-40°C ≤ T _j ≤ 85°C	60			years
t _{RET_105}	Flash memory data retention	-40°C ≤ T _j ≤ 105°C	11.4			years
Program and Erase Timing						
t _{PROG} (WORD, 64)	Program time for flash word ^{(4) (6)}		50	275		μs
t _{PROG} (SEC, 64)	Program time for 1kB sector ^{(5) (6)}		6.4			ms
t _{ERASE} (SEC)	Sector erase time	≤2k erase/program cycles, T _j ≥25°C	4	20		ms
t _{ERASE} (SEC)	Sector erase time	≤10k erase/program cycles, T _j ≥25°C	20	150		ms
t _{ERASE} (SEC)	Sector erase time	≤10k erase/program cycles	20	200		ms
t _{ERASE} (BANK)	Bank erase time	≤10k erase/program cycles	22	220		ms

- (1) The lower 32kB flash address space supports higher erase/program endurance to enable EEPROM emulation applications. On devices with <=32kB flash memory, the entire flash memory supports NWEC_(LOWER) erase/program cycles.
- (2) Total number of cumulative erase operations supported by the flash before failure. A sector erase or bank erase operation is considered to be one erase operation.
- (3) Maximum number of write operations allowed per word line before the word line must be erased. If additional writes to the same word line are required, a sector erase is required once the maximum number of write operations per word line is reached.
- (4) Program time is defined as the time from when the program command is triggered until the command completion interrupt flag is set in the flash controller.
- (5) Sector program time is defined as the time from when the first word program command is triggered until the final word program command completes and the interrupt flag is set in the flash controller. This time includes the time needed for software to load each flash word (after the first flash word) into the flash controller during programming of the sector.
- (6) Flash word size is 64 data bits (8 bytes). On devices with ECC, the total flash word size is 72 bits (64 data bits plus 8 ECC bits).

t_{DELAY}	Delay time from edge of asynchronous request to first 32MHz MCLK edge	Mode is SLEEP2		0.9		us
		Mode is STOP1		2.4		us
		Mode is STOP2		0.9		us
		Mode is STANDBY1		3.2		us
Startup Timing						
$t_{START, RESET}$	Device cold start-up time from reset/power-up ⁽²⁾	Fast boot enabled		241		us
		Fast boot disabled		284		us
NRST Timing						
$t_{RST, BOOTRST}$	Minimum pulse length on NRST pin to generate BOOTRST	ULPCLK \geq 4MHz		2		us
		ULPCLK=32kHz		100		us
$t_{RST, POR}$	Minimum pulse length on NRST pin to generate POR			1		s

- (1) The wake-up time is measured from the edge of an external signal (GPIO wake-up event) to the time that the first CPU instruction is executed, with the GPIO glitch filter disabled (FILTEREN=0x0) and fast wake enabled (FASTWAKEONLY=1)
- (2) The start-up time is measured from the time that VDD crosses VBOR0+ (cold start-up) to the time that the first instruction of the user program is executed.

- (1) The SYSOSC frequency correction loop (FCL) enables high SYSOSC accuracy via an external reference resistor (R_{OSC}) which must be connected between the device ROSC pin and VSS when using the FCL. Accuracies are shown for a $\pm 0.1\% \pm 25\text{ppm } R_{OSC}$; relaxed tolerance resistors may also be used (with reduced SYSOSC accuracy). See the SYSOSC section of the technical reference manual for details on computing SYSOSC accuracy for various R_{OSC} accuracies. R_{OSC} does not need to be populated if the FCL is not enabled.
- (2) Represents the device accuracy only. The tolerance and temperature drift of the ROSC resistor used must be combined with this spec to determine final accuracy. Performance for a $\pm 0.1\% \pm 25\text{ppm } R_{OSC}$ is given as a reference point.
- (3) When SYSOSC is waking up (for example, when exiting a low power mode) and FCL is enabled, the SYSOSC will initially undershoot the target frequency f_{SYSOSC} by an additional error of up to $f_{settle, SYSOSC}$ for the time $t_{settle, SYSOSC}$, after which the target accuracy is achieved.

7.9.1.1 SYSOSC Typical Frequency Accuracy

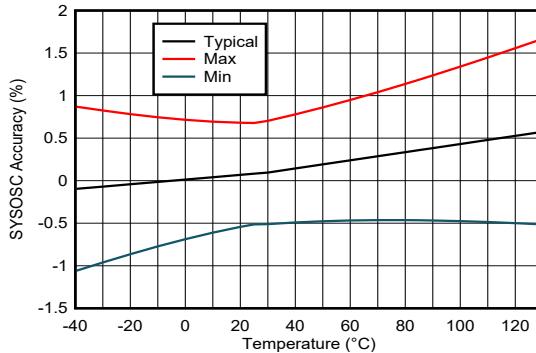

Figure 7-2. SYSOSC Accuracy with FCL On (32MHz)

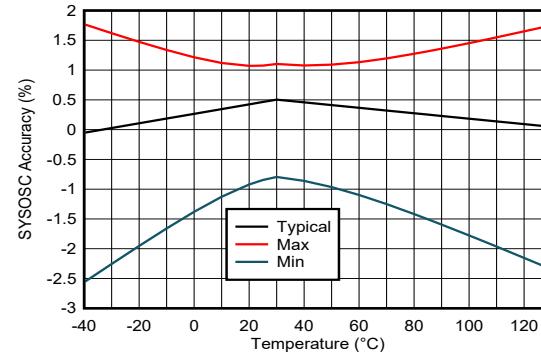

Figure 7-3. SYSOSC Accuracy with FCL Off (32MHz)

FCL-on accuracy is based on a 0.1% tolerance 25 ppm/ $^{\circ}\text{C}$ ROSC resistor.

(1) I/O Types: ODIO = 5V Tolerant Open-Drain , SDIO = Standard-Drive , HSIO = High-Speed

(2) The leakage current is measured with VSS or VDD applied to the corresponding pin(s), unless otherwise noted.

- (3) The leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup/pulldown resistor is disabled.
(4) This value is for SDIO not muxed with any analog inputs. If the SDIO is muxed with analog inputs then the leakage can be as high as 100nA.

7.12.3 Linearity Parameters

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted), all TYP values are measured at 25°C and all linearity parameters are measured using 12-bit resolution mode (unless otherwise noted) ⁽¹⁾

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
E _I	Integral linearity error (INL)	External reference ⁽²⁾		-2.0		+2.0	LSB
E _D	Differential linearity error (DNL) Guaranteed no missing codes	External reference ⁽²⁾		-1.0		+1.0	LSB
E _O	Offset error	External reference ⁽²⁾		-3		3	mV
		Internal reference, V _{R+} = VREF = 2.5V		-3		3	mV
E _G	Gain error	External reference ⁽²⁾		-3		3	LSB

- (1) Total Unadjusted Error (TUE) can be calculated from E_I, E_O, and E_G using the following formula: TUE = √(E_I² + |E_O|² + E_G²)
Note: You must convert all of the errors into the same unit, usually LSB, for the above equation to be accurate
- (2) All external reference specifications are measured with VR+ = VREF+ = VDD = 3.3V and VR- = VREF- = VSS = 0V and external 1uF cap on VREF+ pin

7.12.4 Typical Connection Diagram

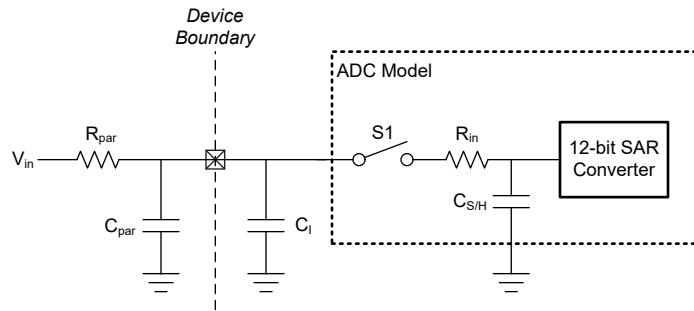

Figure 7-4. ADC Input Network

1. Refer to [ADC Electrical Characteristics](#) for the values of R_{in} and $C_{S/H}$
2. Refer to [Digital IO Electrical Characteristics](#) for the value of C_I
3. C_{par} and R_{par} represent the parasitic capacitance and resistance of the external ADC input circuitry

Use the following equations to solve for the minimum sampling time (T) required for an ADC conversion:

1. $\text{Tau} = (R_{par} + R_{in}) \times C_{S/H} + R_{par} \times (C_{par} + C_I)$
2. $K = \ln(2^n/\text{Settling error}) - \ln((C_{par} + C_I)/C_{S/H})$
3. $T \text{ (Min sampling time)} = K \times \text{Tau}$

8 Detailed Description

The following sections describe all of the components that make up the devices in this data sheet. The peripherals integrated into these devices are configured by software through Memory Mapped Registers (MMRs). For more details, see the corresponding chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.1 CPU

The CPU subsystem (MCPUSS) implements an Arm Cortex-M0+ CPU, an instruction prefetch and cache, a system timer, and interrupt management features. The Arm Cortex-M0+ is a cost-optimized 32-bit CPU that delivers high performance and low power to embedded applications. Key features of the CPU Sub System include:

- Arm Cortex-M0+ CPU supports clock frequencies from 32 kHz to 32 MHz
 - ARMv6-M Thumb instruction set (little endian) with single-cycle 32×32 multiply instruction
 - Single-cycle access to GPIO registers through Arm single-cycle IO port
- Prefetch logic to improve sequential code execution, and I-cache with 2 64-bit cache lines
- System timer (SysTick) with 24-bit down counter and automatic reload
- Nested vectored interrupt controller (NVIC) with 4 programmable priority levels and tail chaining
- Interrupt groups for expanding the total interrupt sources, with jump index for low interrupt latency

8.2 Operating Modes

MSPM0L MCUs provide five main operating modes (power modes) to allow for optimization of the device power consumption based on application requirements. In order of decreasing power, the modes are: RUN, SLEEP, STOP, STANDBY, and SHUTDOWN. The CPU is active executing code in RUN mode. Peripheral interrupt events can wake the device from SLEEP, STOP, or STANDBY mode to the RUN mode. SHUTDOWN mode completely disables the internal core regulator to minimize power consumption, and wake is only possible via NRST, SWD, or a logic level match on certain IOs. RUN, SLEEP, STOP, and STANDBY modes also include several configurable policy options (for example, RUN.x) for balancing performance with power consumption.

To further balance performance and power consumption, MSPM0L devices implement two power domains: PD1 (for the CPU, memories, and high performance peripherals), and PD0 (for low speed, low power peripherals). PD1 is always powered in RUN and SLEEP modes, but is disabled in all other modes. PD0 is always powered in RUN, SLEEP, STOP, and STANDBY modes. PD1 and PD0 are both disabled in SHUTDOWN mode.

8.2.1 Functionality by Operating Mode (MSPM0L110x)

Table 8-1 lists the supported functionality in each operating mode.

Functional key:

- **EN**: The function is enabled in the specified mode.
- **DIS**: The function is disabled (either clock or power gated) in the specified mode, but the function's configuration is retained.
- **OPT**: The function is optional in the specified mode, and remains enabled if configured to be enabled.
- **NS**: The function is not automatically disabled in the specified mode, but it is not supported.
- **OFF**: The function is fully powered off in the specified mode, and no configuration information is retained.

- (1) If STOP0 is entered from RUN1 (SYSOSC enabled but MCLK sourced from LFCLK), SYSOSC remains enabled as it was in RUN1 and ULPCLK remains at 32 kHz as it was in RUN1. If STOP0 is entered from RUN2 (SYSOSC was disabled and MCLK was sourced from LFCLK), SYSOSC remains disabled as it was in RUN2 and ULPCLK remains at 32 kHz as it was in RUN2.
- (2) When using the STANDBY1 policy for STANDBY, only TIMG0 and TIMG1 are clocked. Other PD0 peripherals can generate an asynchronous fast clock request upon external activity but are not actively clocked.

8.3 Power Management Unit (PMU)

The power management unit (PMU) generates the internally regulated core supplies for the device and provides supervision of the external supply (VDD). The PMU also contains the bandgap voltage reference used by the PMU itself as well as analog peripherals. Key features of the PMU include:

- Power-on reset (POR) supply monitor

- Brownout reset (BOR) supply monitor with early warning capability using three programmable thresholds
- Core regulator with support for RUN, SLEEP, STOP, and STANDBY operating modes to dynamically balance performance with power consumption
- Parity-protected trim to immediately generate a power-on reset (POR) in the event that a power management trim is corrupted

For more details, see the PMU chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.4 Clock Module (CKM)

The clock module provides the following oscillators:

- **LFOSC**: Internal low-frequency oscillator (32 kHz)
- **SYSOSC**: Internal high-frequency oscillator (4 MHz or 32 MHz with factory trim, 16 MHz or 24 MHz with user trim)

The following clocks are distributed by the clock module for use by the processor, bus, and peripherals:

- **MCLK**: Main system clock for PD1 peripherals, derived from SYSOSC or LFCLK, active in RUN and SLEEP modes
- **CPUCLK**: Clock for the processor (derived from MCLK), active in RUN mode
- **ULPCLK**: Ultra-low power clock for PD0 peripherals, active in RUN, SLEEP, STOP, and STANDBY modes
- **MFCLK**: 4-MHz fixed mid-frequency clock for peripherals, available in RUN, SLEEP, and STOP modes
- **LFCLK**: 32-kHz fixed low-frequency clock for peripherals or MCLK, active in RUN, SLEEP, STOP, and STANDBY modes
- **ADCCLK**: ADC clock, available in RUN, SLEEP and STOP modes
- **CLK_OUT**: Used to output a clock externally, available in RUN, SLEEP, STOP, and STANDBY modes

For more details, see the CKM chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.5 DMA

The direct memory access (DMA) controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA can be used to move data from ADC conversion memory to SRAM. The DMA reduces system power consumption by allowing the CPU to remain in low power mode, without having to awaken to move data to or from a peripheral.

The DMA in these devices support the following key features:

- 3 independent DMA transfer channels
 - 1 full-feature channel (DMA0), supporting repeated transfer modes
 - 2 basic channels (DMA1, DMA2), supporting single transfer modes
- Configurable DMA channel priorities
- Byte (8-bit), short word (16-bit), word (32-bit) and long word (64-bit) or mixed byte and word transfer capability
- Transfer counter block size supports up to 64k transfers of any data type
- Configurable DMA transfer trigger selection
- Active channel interruption to service other channels
- Early interrupt generation for ping-pong buffer architecture
- Cascading channels upon completion of activity on another channel
- Stride mode to support data re-organization

[Table 8-2](#) lists the available triggers for the DMA which are configured using the DMATCTL.DMATSEL control bits in the DMA memory mapped registers.

8.6 Events

The event manager transfers digital events from one entity (for example, a peripheral) to another (for example, a second peripheral, the DMA or the CPU). The event manager implements event transfer through a defined set of event publishers (generators) and subscribers (receivers) that are interconnected through an event fabric containing a combination of static and programmable routes.

Events that are transferred by the event manager include:

- Peripheral event transferred to the CPU as an interrupt request (IRQ) (Static Event)
 - Example: GPIO interrupt is sent to the CPU
- Peripheral event transferred to the DMA as a DMA trigger (DMA Event)
 - Example: UART data receive trigger to DMA to request a DMA transfer
- Peripheral event transferred to another peripheral to directly trigger an action in hardware (Generic Event)
 - Example: TIMx timer peripheral publishes a periodic event to the ADC subscriber port, and the ADC uses the event to trigger start-of-sampling

For more details, see the Event chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

Table 8-3. Generic Event Channels

A generic route is either a point-to-point (1:1) route or a point-to-two (1:2) splitter route in which the peripheral publishing the event is configured to use one of several available generic route channels to publish the event to another entity (or entities, in the case of a splitter route). An entity can be another peripheral, a generic DMA trigger event, or a generic CPU event.

0	No generic event channel selected	N/A
1	Generic event channel 1 selected	1 : 1
2	Generic event channel 2 selected	1 : 1
3	Generic event channel 3 selected	1 : 2 (splitter)

8.7 Memory

8.7.1 Memory Organization

Table 8-4 summarizes the memory map of the devices. For more information about the memory region detail, see the *Platform Memory Map* section in the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

(1) First 32KB flash memory (address 0x0000.0000 to 0x0000.8000) has up to 100000 program and erase cycles.

(2) Aliased memory reads the same as the corresponding memory region. Aliased memory is included to keep the compatibility with devices that have ECC.

(3) CPU access to one of the last 8 bytes of a flash region will cause a hard fault. This occurs because the prefetch logic tries to read one flash word (64 bits) ahead, resulting in a read attempt to an invalid memory location.

8.8 Flash Memory

A single bank of nonvolatile flash memory is provided for storing executable program code and application data.

Key features of the flash include:

- In-circuit program and erase operations supported across the entire recommended supply range
- Small 1KB sector sizes (minimum erase resolution of 1KB)
- Up to 100000 program and erase cycles on the lower 32KB of the flash memory, with up to 10000 program and erase cycles on the remaining flash memory (devices with 32KB or less support 100000 cycles on the entire flash memory)

For a complete description of the flash memory, see the NVM chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.9 SRAM

MSPM0Lxx MCUs include a low-power high-performance SRAM memory with zero wait state access across the supported CPU frequency range of the device. SRAM memory can be used for storing volatile information such as the call stack, heap, global data, and code. The SRAM memory content is fully retained in run, sleep, stop, and standby operating modes and is lost in shutdown mode. A write protection mechanism is provided to allow the application to prevent unintended modifications to a portion of the SRAM memory. SRAM write protection is useful when placing executable code into SRAM to provide a level of protection against unintentional overwrites of code by either the CPU or DMA. Placing code in SRAM can improve performance of critical loops by enabling zero wait state operation and lower power consumption.

8.10 GPIO

The general purpose input/output (GPIO) peripheral lets the application write data out and read data in through the device pins. Through the use of the Port A GPIO peripheral, these devices support up to 28 GPIO pins.

The key features of the GPIO module include:

- 0 wait state MMR access from CPU

- Set, clear, or toggle multiple bits without the need of a read-modify-write construct in software
- "FastWake" feature enables low-power wakeup from STOP and STANDBY modes for any GPIO port
- User controlled input filtering

8.11 IOMUX

The IOMUX peripheral enables IO pad configuration and controls digital data flow to and from the device pins. The key features of the IOMUX include:

- IO pad configuration registers allow for programmable drive strength, speed, pullup or pulldown, and more
- Digital pin muxing allows for multiple peripheral signals to be routed to the same IO pad
- Pin functions and capabilities are user-configured using the PINCM register

For more details, see the IOMUX chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.12 ADC

The 12-bit analog-to-digital converter (ADC) module in these devices support fast 12-bit conversions with single-ended inputs.

ADC features include:

- 12-bit output resolution at up to 1.68 Msps with greater than 11 ENOB
- Up to 10 external input channels
- Internal channels for temperature sensing, supply monitoring, and analog signal chain (for example, interconnection with OPA or GPAMP)
- Software selectable reference:
 - Configurable internal dedicated ADC reference voltage of 1.4 V and 2.5 V (VREF)
 - MCU supply voltage (VDD)
 - External reference supplied to the ADC through the VREF+ and VREF- pins
- Operates in RUN, SLEEP, and STOP modes and supports triggers from STANDBY mode

Table 8-7. ADC0 Channel Mapping

CHANNEL[0:7]	SIGNAL NAME	CHANNEL[8:15]	SIGNAL NAME 1
0	A0	8	A8
1	A1	9	A9
2	A2	10	-
3	A3	11	<i>Temperature Sensor</i>
4	A4	12	
5	A5	13	
6	A6	14	<i>GPAMP output</i>
7	A7	15	<i>Supply/Battery Monitor</i>

1. *Italicized* signal names are internal to the SoC. These signals are used for internal peripheral interconnections.
2. For more information about device analog connections, see [Section 8.22](#).

For more details, see the ADC chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.13 Temperature Sensor

The temperature sensor provides a voltage output that changes linearly with device temperature. The temperature sensor output is internally connected to one of ADC input channels to enable a temperature-to-digital conversion.

A unit-specific single-point calibration value for the temperature sensor is provided in the factory constants memory region. This calibration value represents the ADC conversion result (in ADC code format) corresponding

to the temperature sensor being measured in 12-bit mode with VDD = 3.3V at the factory trim temperature ($T_{S_{TRIM}}$). The ADC and VREF configuration for the above measurement is as the following: RES=0 (12-bit mode), VRSEL=0h (VDD), ADC t_{Sample} =12.5 μ s. This calibration value can be used with the temperature sensor temperature coefficient (T_{S_c}) to estimate the device temperature. See the temperature sensor section of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#) for guidance on estimating the device temperature with the factory trim value.

8.14 VREF

The voltage reference module (VREF) in these devices contains a configurable voltage reference buffer dedicated for the on-board ADC. The devices also support connection of an external reference for applications in which higher accuracy is required.

VREF features include:

- 1.4-V and 2.5-V user-selectable internal reference for ADC
- Internal reference supports ADC operation up to 200 kspS
- Support for bringing in an external reference for the ADC as well as for other analog peripherals on the VREF+ and VREF- device pins (24, 28, and 32-pin packages only)

For more details, see the VREF chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.15 GPAMP

The general-purpose amplifier (GPAMP) peripheral is a chopper-stabilized general-purpose operational amplifier with rail-to-rail input and output.

The GPAMP supports the following features:

- Software selectable chopper stabilization
- Rail-to-rail input and output
- Programmable internal unity gain feedback loop

For more details, see the ADC chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.16 CRC

The cyclical redundancy check (CRC) module provides a signature for an input data sequence. Key features of the CRC module include:

- Support for 16-bit CRC based on CRC16-CCITT
- Support for 32-bit CRC based on CRC32-ISO3309
- Support for bit reversal

For more details, see the CRC chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.17 UART

The UART peripherals provide the following key features:

- Standard asynchronous communication bits for start, stop, and parity
- Fully programmable serial interface
 - 5, 6, 7 or 8 data bits
 - Even, odd, stick, or no-parity bit generation and detection
 - 1 or 2 stop bit generation
 - Line-break detection
 - Glitch filter on the input signals
 - Programmable baud rate generation with oversampling by 16, 8 or 3

- Local Interconnect Network (LIN) mode support
- Separated transmit and receive FIFOs support DMA data transfer
- Support transmit and receive loopback mode operation
- See [Table 8-8](#) for detail information on supported protocols

Table 8-8. UART Features

UART Features	UART0 (Extend)	UART1 (Main)
Active in Stop and Standby Mode	Yes	Yes
Separate transmit and receive FIFOs	Yes	Yes
Support hardware flow control	Yes	Yes

For more details, see the UART chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.18 SPI

The serial peripheral interface (SPI) peripherals in these devices support the following key features:

- Support ULPCLK/2 bit rate and up to 16Mbits/s in both controller and peripheral mode
- Configurable as a controller or a peripheral
- Configurable chip select for both controller and peripheral
- Programmable clock prescaler and bit rate
- Programmable data frame size from 4 bits to 16 bits (controller mode) and 7 bits to 16 bit (peripheral mode)
- Supports PACKEN feature that allows the packing of 2 16 bit FIFO entries into a 32-bit value to improve CPU performance
- Transmit and receive FIFOs (4 entries each with 16 bits per entry) supporting DMA data transfer
- Supports TI mode, Motorola mode and National Microwire format

For more details, see the SPI chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.19 I2C

The inter-integrated circuit interface (I²C) peripherals in these devices provide bidirectional data transfer with other I²C devices on the bus and support the following key features:

- 7-bit and 10-bit addressing mode with multiple 7-bit target addresses
- Multiple-controller transmitter or receiver mode
- Target receiver or transmitter mode with configurable clock stretching
- Support Standard-mode (Sm), with a bit rate up to 100 kbit/s
- Support Fast-mode (Fm), with a bit rate up to 400 kbit/s
- Support Fast-mode Plus (Fm+), with a bit rate up to 1 Mbit/s
 - Supported on open drain IOs only (ODIO)
- Separated transmit and receive FIFOs support DMA data transfer
- Support SMBus 3.0 with PEC, ARP, timeout detection and host support
- Wakeup from low power mode on address match
- Support analog and digital glitch filter for input signal glitch suppression
- 8-entry transmit and receive FIFOs

For more details, see the I²C chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.20 WWDT

The windowed watchdog timer (WWDT) can be used to supervise the operation of the device, specifically code execution. The WWDT can be used to generate a reset or an interrupt if the application software does not successfully reset the watchdog within a specified window of time. Key features of the WWDT include:

- 25-bit counter
- Programmable clock divider
- Eight software selectable watchdog timer periods
- Eight software selectable window sizes
- Support for stopping the WWDT automatically when entering a sleep mode
- Interval timer mode for applications which do not require watchdog functionality

For more details, see the WWDT chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.21 Timers (TIMx)

The timer peripherals in these devices support the following key features. For specific configuration, see [Table 8-9](#).

Specific features for the **general-purpose timer (TIMGx)** include:

- 16-bit timers with up, down or up-down counting modes, with repeat-reload mode
- Selectable and configurable clock source
- 8-bit programmable prescaler to divide the counter clock frequency
- Two independent channels for
 - Output compare
 - Input capture
 - PWM output
 - One-shot mode
- Support quadrature encoder interface (QEI) for positioning and movement sensing
- Support synchronization and cross trigger among different TIMx instances in the same power domain
- Support interrupt/DMA trigger generation and cross peripherals (such as ADC) trigger capability
- Cross-trigger event logic for Hall sensor inputs

8.23 Input/Output Diagrams

The IOMUX manages the selection of which peripheral function is to be used on a digital IO and provides the controls for the output driver, input path, and the wake-up logic for wakeup from SHUTDOWN mode. For more information, see the IOMUX section of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

The mixed-signal IO pin slice diagram for a full featured IO pin is shown in Figure 8-2. Not all pins have analog functions, wake-up logic, drive strength control, and pullup or pulldown resistors available. See the device-specific data sheet for detailed information on what features are supported for a specific pin.

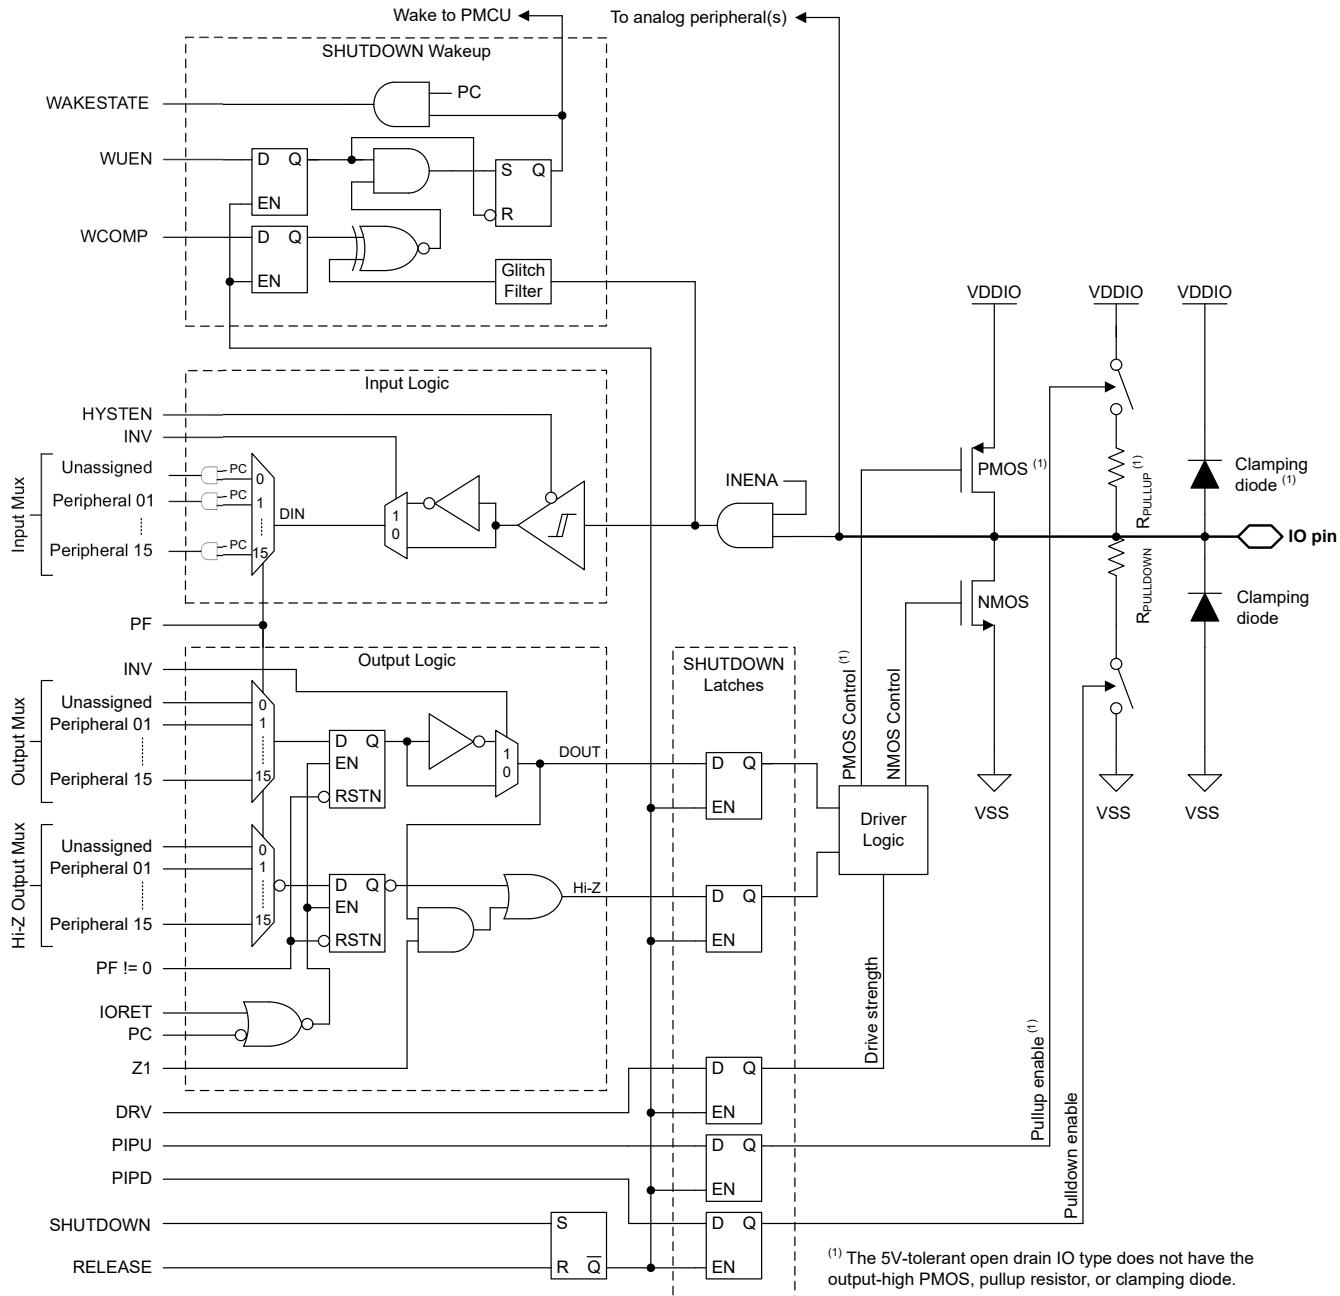

Figure 8-2. Superset Input/Output Diagram

8.24 Bootstrap Loader (BSL)

The bootstrap loader (BSL) enables configuration of the device as well as programming of the device memory through a UART or I²C serial interface. Access to the device memory and configuration through the BSL is protected by a 256-bit user-defined password, and it is possible to completely disable the BSL in the device configuration, if desired. The BSL is enabled by default from TI to support use of the BSL for production programming.

A minimum of two pins are required to use the BSL: the BSLRX and BSLTX signals (for UART), or the BSLSCL and BSLSDA signals (for I²C). Additionally, one or two additional pins (BSL_invoke and NRST) may be used for controlled invocation of the bootloader by an external host.

If enabled, the BSL may be invoked (started) in the following ways:

- The BSL is invoked during the boot process if the BSL_invoke pin state matches the defined BSL_invoke logic level. If the device fast boot mode is enabled, this invocation check is skipped. An external host can force the device into the BSL by asserting the invoke condition and applying a reset pulse to the NRST pin to trigger a BOOTRST, after which the device will verify the invoke condition during the reboot process and start the BSL if the invoke condition matches the expected logic level.
- The BSL is automatically invoked during the boot process if the reset vector and stack pointer are left unprogrammed. As a result, a blank device from TI will invoke the BSL during the boot process without any need to provide a hardware invoke condition on the BSL_invoke pin. This enables production programming using just the serial interface signals.
- The BSL may be invoked at runtime from application software by issuing a SYSRST with BSL entry command.

Table 8-11. BSL Pin Requirements and Functions

DEVICE SIGNAL	CONNECTION	BSL FUNCTION
BSLRX	Required for UART	UART receive signal (RXD), an input
BSLTX	Required for UART	UART transmit signal (TXD) an output
BSLSCL	Required for I2C	I ² C BSL clock signal (SCL)
BSLSDA	Required for I2C	I ² C BSL data signal (SDA)
BSL_invoke	Optional	Active-high digital input used to start the BSL during boot
NRST	Optional	Active-low reset pin used to trigger a reset and subsequent check of the invoke signal (BSL_invoke)

8.25 Serial Wire Debug Interface

A serial wire debug (SWD) two-wire interface is provided via an Arm compatible serial wire debug port (SW-DP) to enable access to multiple debug functions within the device. For a complete description of the debug functionality offered on MSPM0 devices, see the debug chapter of the technical reference manual.

Table 8-12. Serial Wire Debug Pin Requirements and Functions

DEVICE SIGNAL	DIRECTION	SWD FUNCTION
SWCLK	Input	Serial wire clock from debug probe
SWDIO	Input/Output	Bi-directional (shared) serial wire data

8.26 Device Factory Constants

All devices include a memory-mapped FACTORY region which provides read-only data describing the capabilities of a device as well as any factory-provided trim information for use by application software. See the *Factory Constants* section of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

8.27 Identification

Revision and Device Identification

The hardware revision and device identification values are stored in the memory-mapped FACTORY region (see the Device Factory Constants section) which provides read-only data describing the capabilities of a device as well as any factory-provided trim information for use by application software. For more information, see the *Factory Constants* chapter of the [MSPM0 L-Series 32-MHz Microcontrollers Technical Reference Manual](#).

The device revision and identification information are also included as part of the top-side marking on the device package. The device-specific errata describes these markings.

9 Applications, Implementation, and Layout

9.1 Typical Application

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1.1 Schematic

TI recommends connecting a combination of a 10- μ F and a 0.1- μ F low-ESR ceramic decoupling capacitor across the VDD and VSS pins, as well as placing these capacitors as close as possible to the supply pins that they decouple (within a few millimeters) to achieve a minimal loop area. The 10- μ F bulk decoupling capacitor is a recommended value for most applications, but this capacitance may be adjusted if needed based upon the PCB design and application requirements. For example, larger bulk capacitors can be used, but this can affect the supply rail ramp-up time.

The NRST reset pin must be pulled up to VDD (supply level) for the device to release from RESET state and start the boot process. TI recommends connecting an external 47-k Ω pullup resistor with a 10-nF pulldown capacitor for most applications, enabling the NRST pin to be controlled by another device or a debug probe.

The SYSOSC frequency correction loop (FCL) circuit utilizes an external 100-k Ω with 0.1% tolerance resistor with a temperature coefficient (TCR) of 25ppm/C or better populated between the ROSC pin and VSS. This resistor establishes a reference current to stabilize the SYSOSC frequency through a correction loop. This resistor is required if the FCL feature is used for higher accuracy, and it is not required if the SYSOSC FCL is not enabled. When the FCL mode is not used, the PA2 pin may be used as a digital input/output pin.

A 0.47- μ F tank capacitor is required for the VCORE pin and must be placed close to the device with minimum distance to the device ground. Do not connect other circuits to the VCORE pin.

For the 5-V-tolerant open drain (ODIO), a pullup resistor is required to output high for I₂C and UART functions, as the open drain IO only implement a low-side NMOS driver and no high-side PMOS driver. The 5V-tolerant open drain IO are fail-safe and may have a voltage present even if VDD is not supplied.

10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

10.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices and support tools. . Each MSP MCU commercial family member has one of two prefixes: MSP or X. These prefixes represent evolutionary stages of product development from engineering prototypes (X) through fully qualified production devices (MSP).

X or XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

X and XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes." MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies. Predictions show that prototype devices (X) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [Figure 10-1](#) provides a legend for reading the complete device name.

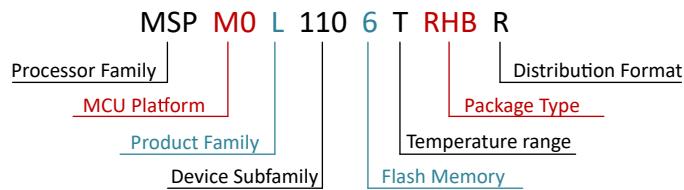

Figure 10-1. Device Nomenclature

Table 10-1. Device Nomenclature

Processor Family	MSP = Mixed-signal processor X, XMS = Experimental silicon
MCU Platform	M0 = Arm-based 32-bit M0+
Product Family	L = 32-MHz frequency
Device Subfamily	110 = ADC
Internal Memory	5 = 32KB flash, 4KB SRAM 6 = 64KB flash, 4KB SRAM
Temperature Range	T = -40°C to 105°C
Package Type	See Table 5-1 and www.ti.com/packaging
Distribution Format	T = Small reel R = Large reel No marking = Tube or tray

For orderable part numbers of MSP devices in different package types, see the Package Option Addendum of this document, ti.com, or contact your TI sales representative.

10.2 Tools and Software

Design Kits and Evaluation Modules

MSPM0 LaunchPad Development Kit: LP-MSPM0L1306	Empowers you to immediately start developing on the industry's best integrated analog and most cost-optimized general purpose MSPM0 MCU family. Exposes all device pins and functionality; includes some built-in circuitry, out-of-box software demos, and on-board XDS110 debug probe for programming, debugging, and EnergyTrace™ technology. The LaunchPad ecosystem includes dozens of BoosterPack™ stackable plug-in modules to extend functionality.
--	---

Embedded Software

MSPM0 Software Development Kit (SDK)	Contains software drivers, middleware libraries, documentation, tools, and code examples that create a familiar and easy user experience for all MSPM0 devices.
--	---

Software Development Tools

TI Cloud Tools	Start your evaluation and development on a web browser without any installation. Cloud tools also have a downloadable, offline version.
TI Resource Explorer	Online portal to TI SDKs. Accessible in CCS IDE or in TI Cloud Tools.
SysConfig	Intuitive GUI to configure device and peripherals, resolve system conflicts, generate configuration code, and automate pin mux settings. Accessible in CCS IDE or in TI Cloud Tools. (offline version)
MSP Academy	Great starting point for all developers to learn about the MSPM0 MCU Platform with training modules that span a wide range of topics. Part of TIRex.
GUI Composer	GUIs that simplify evaluation of certain MSPM0 features, such as configuring and monitoring a fully integrated analog signal chain without any code needed.

IDE and compiler tool chains

Code Composer Studio™ (CCS)	Includes TI Arm-Clang compiler. Supports all TI Arm Cortex MCUs and boasts competitive code size performance advantages, fast compile time, code coverage support, safety certification support, and completely free to use.
IAR Embedded Workbench® IDE	
Keil® MDK IDE	
GNU Arm Embedded Tool Chain	

10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.4 Trademarks

LaunchPad™, Code Composer Studio™, TI E2E™, EnergyTrace™, and BoosterPack™ are trademarks of Texas Instruments.

Arm® and Cortex® are registered trademarks of Arm Limited.

All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

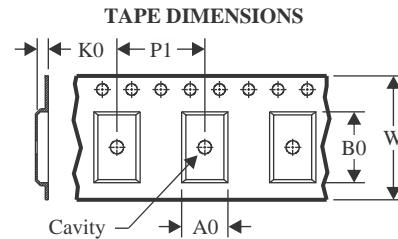

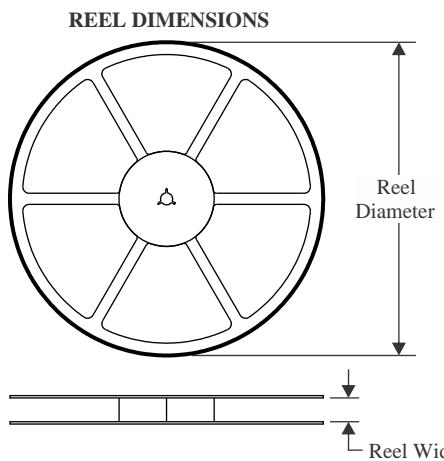

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

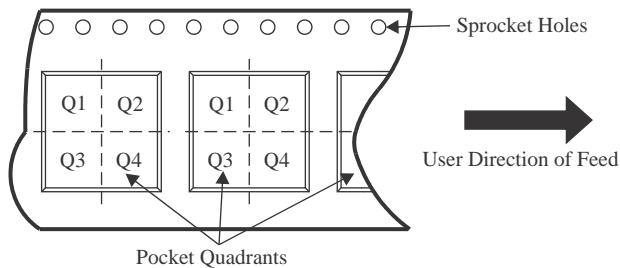

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
